

MOLAR AI

THE DENTIST'S CHATGPT SOP PLAYBOOK

How to talk through the way your practice already works and turn it into a clear SOP manual your team can actually follow.

The workflow: Talk → Organize → Review → Approve → Train

The goal is not to write a 200-page binder nobody reads. It is to capture the recurring processes that make your practice consistent, then turn them into simple instructions, checklists, and training tools.

Built for dentists and practice owners who have too many processes living inside people's heads.

Do not write them. Explain them.

Open ChatGPT, start a voice conversation, and explain a process exactly like you would explain it to a new employee on their first week.

- 1 Pick one process**
Do not try to document the entire practice in one conversation. Start with one repeatable workflow.
- 2 Open ChatGPT Voice**
Use the voice icon and talk through the process naturally.
- 3 Explain what really happens**
Who starts it, what information they need, which system they use, what can go wrong, and how the process ends.
- 4 Let ChatGPT interview you**
Tell it to ask follow-up questions whenever the process is unclear or missing a decision point.
- 5 Generate the SOP**
Have ChatGPT turn the conversation into a step-by-step SOP, checklist, training summary, and manager audit.

START THE VOICE CONVERSATION WITH THIS

I am going to explain how our dental practice handles **[PROCESS]**. Act like an operations manager documenting this process. Listen first. Do not write the SOP until I say I am finished. As I explain it, ask me one follow-up question at a time whenever: - a step is unclear - I skip who owns the step - there is a decision point - there is an exception - there is no clear definition of "done" When I say "finished," turn the process into: 1) a clean SOP 2) a one-page checklist 3) a training summary for a new employee 4) a manager audit checklist.

Start where inconsistency costs the practice money.

The best first SOPs are high-frequency, high-friction processes that affect patient experience, collections, scheduling, or team accountability.

PRIORITY	SOP	WHY IT MATTERS
1	New patient phone call	Sets expectations and directly affects appointment conversion
2	Insurance verification	Reduces surprises and front-desk rework
3	Cancellations / no-shows	Protects the schedule and defines follow-up
4	Unscheduled treatment follow-up	Creates a consistent process after diagnosed treatment
5	Opening the office	Makes daily readiness measurable
6	Closing the office	Prevents missed tasks at the end of the day
7	Emergency call handling	Clarifies what information to gather and when to escalate
8	New employee onboarding	Makes training less dependent on one person
9	Patient financial conversations	Keeps payment-option explanations consistent
10	Review / referral request	Turns word-of-mouth into a repeatable system

Do not start with clinical protocols. Start with operational workflows the owner already understands well. Clinical SOPs should follow the appropriate professional, legal, manufacturer, and regulatory standards for your practice.

If it cannot be followed, it is not an SOP.

Every SOP should make it obvious who does what, in what order, with what tools, and what happens when something goes wrong.

SECTION	WHAT TO INCLUDE
Purpose	Why this process exists and what outcome it protects
Owner	The role responsible for completing the process
Trigger	What starts the process
Required information	What must be known before starting
Steps	The exact sequence in simple language
Decision points	If X happens, do Y; if not, do Z
Exceptions	Common scenarios that do not follow the normal path
Escalation	When the team must involve a manager or doctor
Definition of done	The measurable result that means the process is complete
Audit	How a manager checks whether the SOP is being followed

TURN MY EXPLANATION INTO A STRONGER SOP

Rewrite this SOP using the following structure: - SOP name - purpose - owner - trigger - required information/tools - step-by-step procedure - decision points - common exceptions - when to escalate - definition of done - manager audit checklist Use clear instructions, not vague advice. If any part of the process is still ambiguous, list the missing decisions at the end instead of guessing.

Documentation is useful. Training is what changes behavior.

Once ChatGPT creates the SOP, use the same source to create multiple tools for the team. One conversation can become the full training package.

OUTPUT	USE
One-page checklist	Keep beside the workstation or in the practice knowledge base
New-hire summary	Teach the process without handing someone a long document
Role-play scenarios	Practice difficult phone calls or exception cases
Quiz	Check that the employee understands the process
Manager audit	Verify the SOP is actually being followed
Coaching script	Give managers consistent language for correcting the process

CREATE THE TRAINING PACK

Using the approved SOP above, create: 1) a one-page employee checklist 2) a 10-question training quiz with answer key 3) 5 realistic role-play scenarios 4) a manager observation checklist 5) the 5 most common mistakes a new employee is likely to make 6) a short coaching script a manager can use when correcting those mistakes Do not add policies that are not in the approved SOP.

One source of truth. Not 17 random Google Docs.

Once several SOPs are approved, combine them into a single organized manual. Keep the editable master in your normal document system, then export a PDF version for easy distribution or reference.

SECTION	EXAMPLES
Front Desk	New patient calls, scheduling, cancellations, insurance verification
Treatment Coordination	Consult follow-up, unscheduled treatment, financial conversations
Daily Operations	Opening, closing, supplies, handoffs
Patient Experience	Review requests, complaint escalation, communication standards
People / Training	Onboarding, role expectations, training checks
Management	Daily huddles, reporting, audits, accountability

MASTER MANUAL PROMPT

Combine these approved SOPs into one dental practice operations manual. Organize them by department. For each SOP include: - title - version number - last reviewed date - owner - purpose - procedure - checklist - audit criteria
Create a table of contents at the beginning. Do not change the approved steps. Flag duplicate or conflicting instructions so I can resolve them before the manual is finalized.

Naming convention

[DEPARTMENT]_[SOP NAME]_v[VERSION]_[YYYY-MM-DD]

Example: FrontDesk_NewPatientCall_v1_2026-08-27

An outdated SOP is worse than no SOP.

Every process needs an owner and a review cadence. If nobody owns the document, the binder slowly becomes fiction.

CADENCE	WHAT TO DO
Monthly	Fix small wording issues discovered by the team
Quarterly	Review high-frequency SOPs and recurring exceptions
After a mistake	Ask whether the SOP was missing, unclear, or simply not followed
After software/process change	Update steps immediately
Annually	Full manual review and version cleanup

AFTER-A-PROBLEM REVIEW

We had the following operational problem: **[DESCRIBE WHAT HAPPENED]**. Compare what happened against this SOP. Tell me: 1) which step was missed 2) whether the SOP was unclear or incomplete 3) whether a new exception should be added 4) what manager coaching is needed 5) the smallest SOP change that would reduce the chance of this happening again Do not rewrite the entire SOP unless necessary.

Compliance note: Administrative SOPs are the easiest place to start. For clinical care, infection control, privacy, employment, billing, and other regulated areas, your SOPs should reflect the standards and legal requirements that apply to your practice and jurisdiction.

MOLAR AI PATIENT EDUCATION LIBRARY

Standardize the practice behind the scenes - and patient education in the operatory.

MOLAR gives dentists and dental teams a growing library of visual patient-education videos built for treatment conversations inside the practice.

Are you a dentist or dental professional?

Use MOLAR chairside, on an iPad, in consultation rooms, or on practice TVs so patients can actually see what you are explaining.

- Visual explanations for treatments, procedures, and dental conditions
- Useful during consultations and treatment discussions
- Built for phones, tablets, computers, and practice TVs
- A growing library your team can use instead of explaining everything from scratch

Explore the MOLAR Patient Education Library
